

Meeting Agenda 21/4

1. Objectives:

A Maven dependency error is preventing progress and testing of implemented code. Everyone in the group is working on a solution.

2. Reports:

The classes are created and some basic implementation of them has begun. Though the implementation has not been tested due to the Maven-issue.

3. Discussion:

Since the issue is preventing further implementation to be tested, this of course is our number one priority. One way or another we should have a running, very basic prototype before our next meeting with our advisor.

Since further research is needed to resolve the Maven-issue the discussion jumps ahead to the order of implementation after the issue is resolved.

After the Maven-problem is resolved we should continue to implement User Cases.

The ones to implement first is decided to be the ones involving input, to see how it will work in relation to the MVC model. Order of implementation is decided to be:

- Walk
- Collision (not a use case but an important and large enough step)
- Jump
- ...

As a secondary objective we should also work on our Design Model. A simple sketch of the model should be finished next week.

Next week the group should start with the SDD according to the Roadmap. As such the group should prepare and read up on this step in the design process.

4. Outcomes and assignments:

All: The whole group is working on resolving the Maven-issue. This is done by searching and asking for solutions everywhere one could think of. Possible ways are to ask Joakim or other

Olof: Should research libGDX and the possibility to switch to it as a last minute solution. If the issue isn't resolved today we switch to libGDX, to avoid more wasted time. Will also update the Use Cases on Git as well as post this meeting.

5. Wrap up:

Since we had the meeting with our advisor on Monday instead of Thursday we now have Thursday to work.

Next meeting Thursday 23/4.
